ABSTRACT:

Asymmetric radio frequency (RF) coils for magnetic resonance applications are provided. Also provided are time harmonic methods for designing such coils as well as symmetric coils. In addition, methods for converting complex current density functions into discrete capacitive and inductive elements are provided.

ABSTRACT:

Systems and methods for discriminating and locating tissues within a body involve applying a waveform signal to tissue between two electrodes and measuring the electrical characteristics of the signal transmitted through the tissue. At least one of the electrodes is constrained in area so that localized electrical

characteristics of the tissue are measured. Such localized electrical characteristics are determined over a portion of a body of the subject by using an array of electrodes or electrodes that can be moved over the body. A controller may implement the process and perform calculations on the measured data to identify tissue types and locations within the measured area, and to present results in graphical form. Results may be combined with other tissue imaging technologies and with image-guided systems.

RELATED APPLICATIONS

[0001] This specification claims the benefit of and priority to U.S. Provisional Patent Application No. 60/619,921 filed Oct. 20, 2004, the entire contents of which are hereby incorporated by reference. This application is also related to U.S. Application No. (to be issued) entitled "Algorithms for an Active Electrode, Bioimpedance-based Tissue Discrimination System" filed concurrently herewith, the entire contents of which are hereby incorporated by reference. This application is also related to U.S. application Ser. Nos. 09/989,206 filed Nov. 21, 2001; Ser. No. 10/170,194 filed on Jun. 13, 2002; Ser. No. 10/772,397 filed Feb. 6, 2004; and Ser. No. 10/853,590 filed May 25, 2004; the contents of each of which are herein incorporated by reference in their entireties.
